Overview

I create a blog application that is called My Story. This app actually aims to save personal important moment in life. This app connects to Firebase database. The user can store informations such as picture, description and the title. Moreover, this app can allow the user to draw the image before uploading it to Firebase.

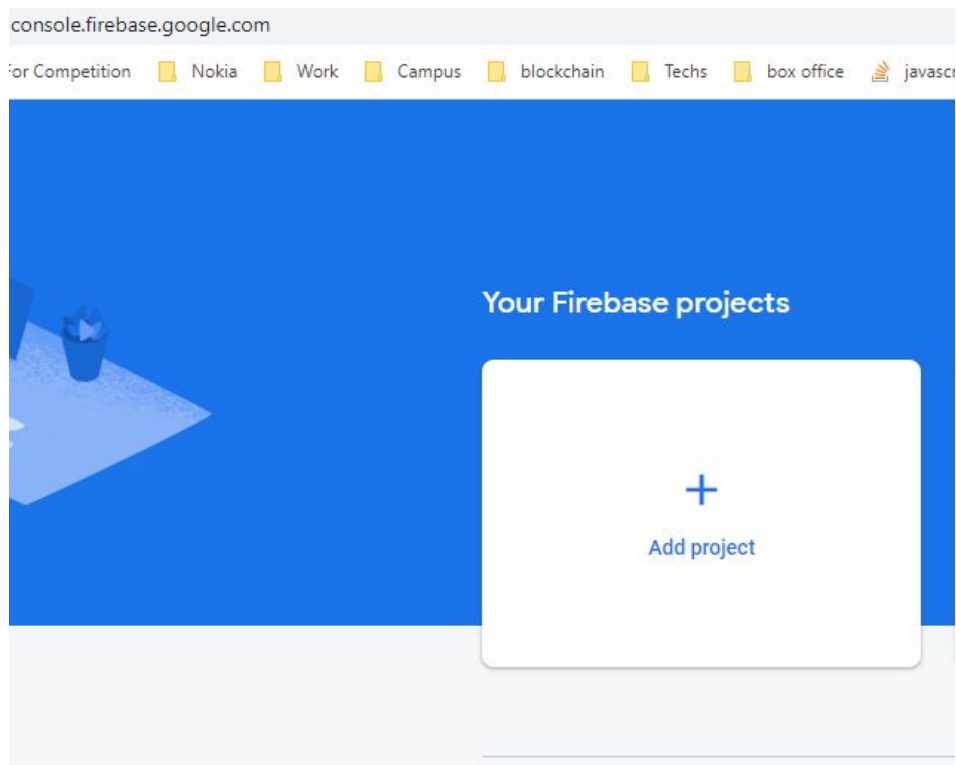

Features:

- Create, read and delete blog post
- Possibility to edit the image before uploading

Implementation

1. Firebase Configuration

In order to use the firebase feature, I need to create a project in console.firebase.google.com

After that, I need to add the app

When the new pop up appears, I chose android.

Add Firebase to your Android app

1

Register app

Android package name ⓘ
com.company.appname

App nickname (optional) ⓘ
My Android App

Debug signing certificate SHA-1 (optional) ⓘ
00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:f

Required for Dynamic Links, Invites, and Google Sign-In or phone number support in Auth. Edit SHA-1s in Settings.

Register app

2

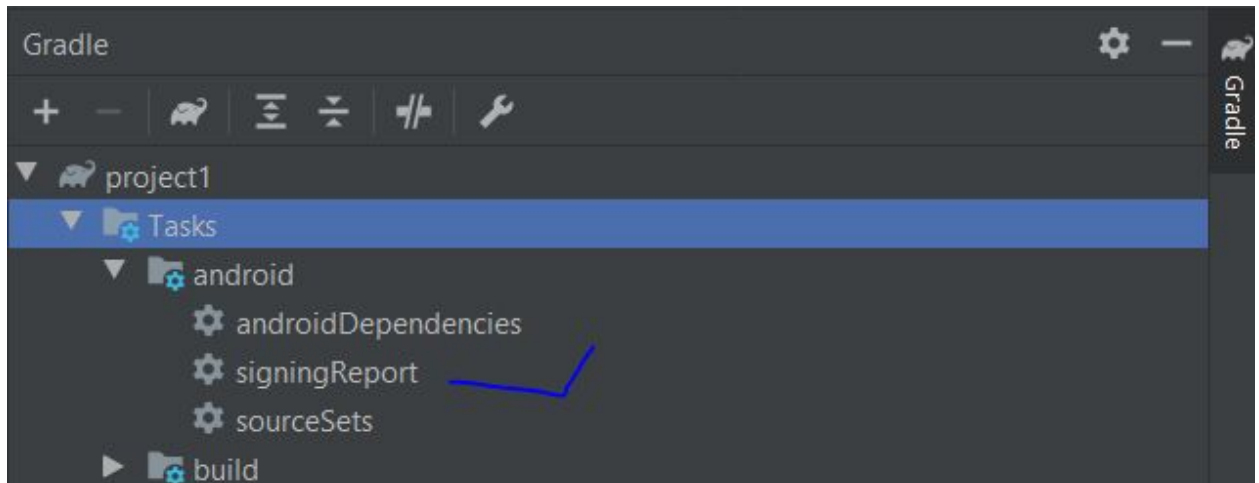

Download config file

3

Add Firebase SDK

4

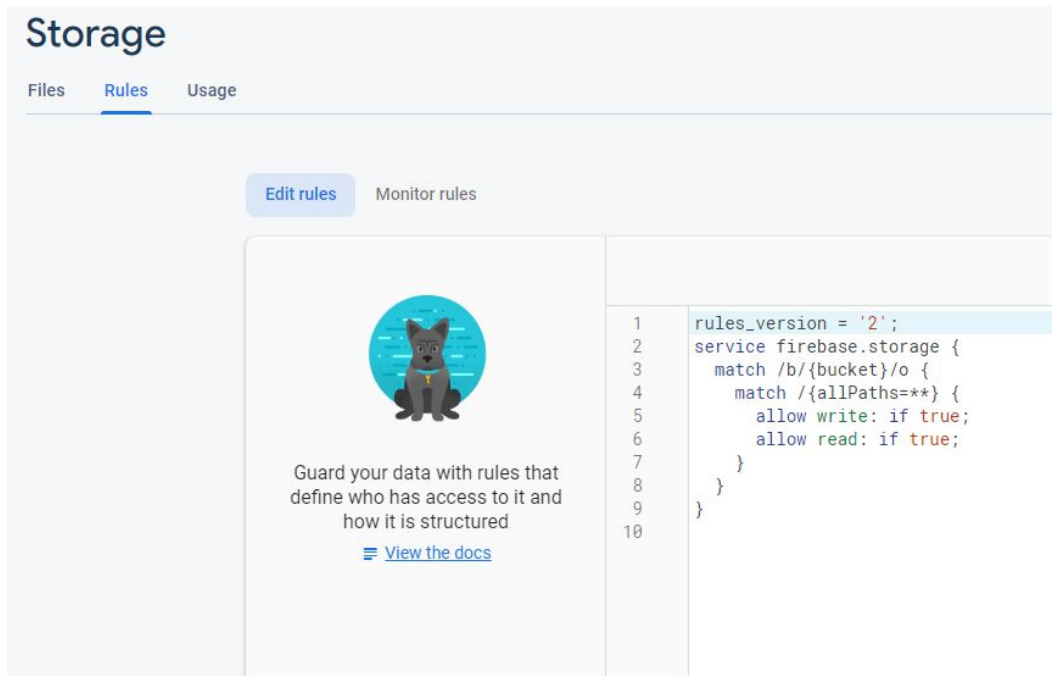

Run your app to verify installation

Once I got the certificate, I register my app. When it's registered, they will generate service-google.json. This contains some credentials that must be put inside the app folder of my project.

Moreover, some rules in the database and storage of Firebase must be configured

2. Create the needed configuration for create, read and delete post and Create configuration for Image editing. Some required dependencies are also implemented such as firebase-database, storage and some photo dependencies. The following image shows the complete dependencies.

```
dependencies {
    implementation fileTree(dir: 'libs', include: ['*.jar'])
    testImplementation 'junit:junit:4.12'
    implementation 'com.android.support:appcompat-v7:28.0.0'
    implementation 'com.android.support.constraint:constraint-layout:1.1.3'
    implementation 'com.android.support:cardview-v7:28.0.0'
    implementation 'com.android.support:recyclerview-v7:28.0.0'
    implementation 'com.squareup.picasso:picasso:2.5.2'
    implementation 'com.android.support:design:28.0.0'
    implementation 'com.android.support:support-v4:28.0.0'
    implementation 'com.android.support:support-vector-drawable:28.0.0'

    //foto
    implementation 'com.android.support:design:28.0.0-alpha3'
    implementation 'com.jaredrummler:colorpicker:1.0.1'
    implementation 'com.github.chrisbanes:PhotoView:2.1.4'

    //firebase
    implementation 'com.google.firebase:firebase-auth:11.8.0'
    implementation 'com.google.firebase:firebase-database:11.8.0'
    implementation 'com.firebaseui:firebase-ui-database:3.2.2'
    implementation 'com.google.firebase:firebase-storage:11.8.0'
}

apply plugin: 'com.google.gms.google-services'
```

3. Test the App

This is the main layout

View all : to see uploaded posts

Add new : to add new post

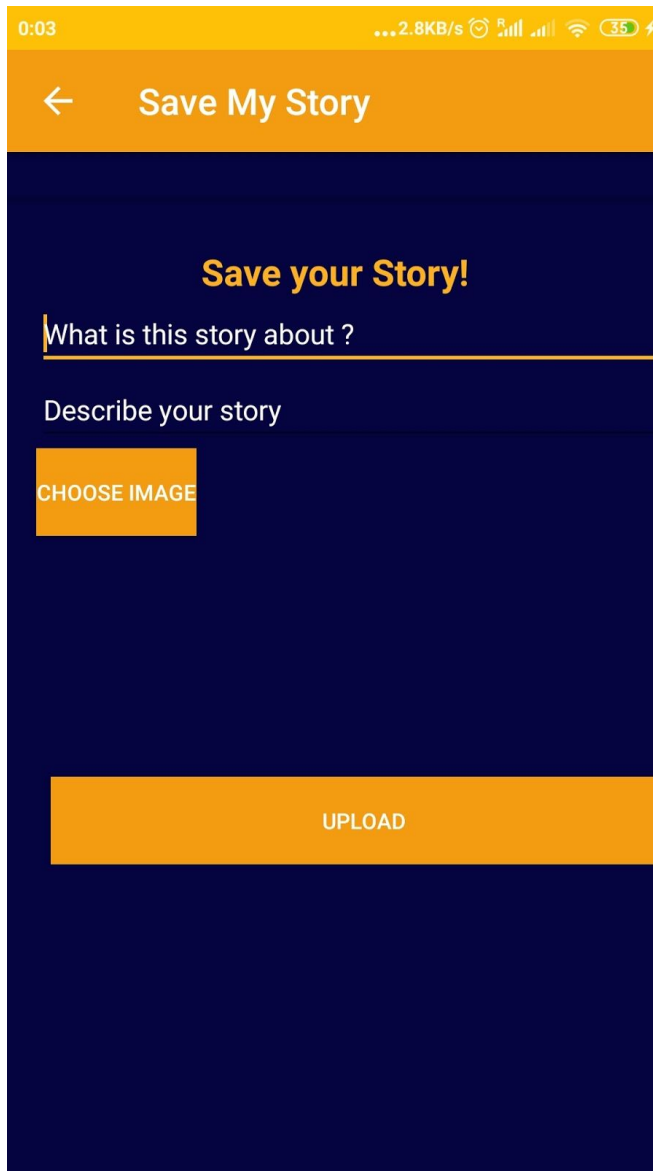

Story Image : to edit the image before uploading it with the post

This is the layout if the “View all” button is clicked

It shows empty list because I deleted all of the post contents.

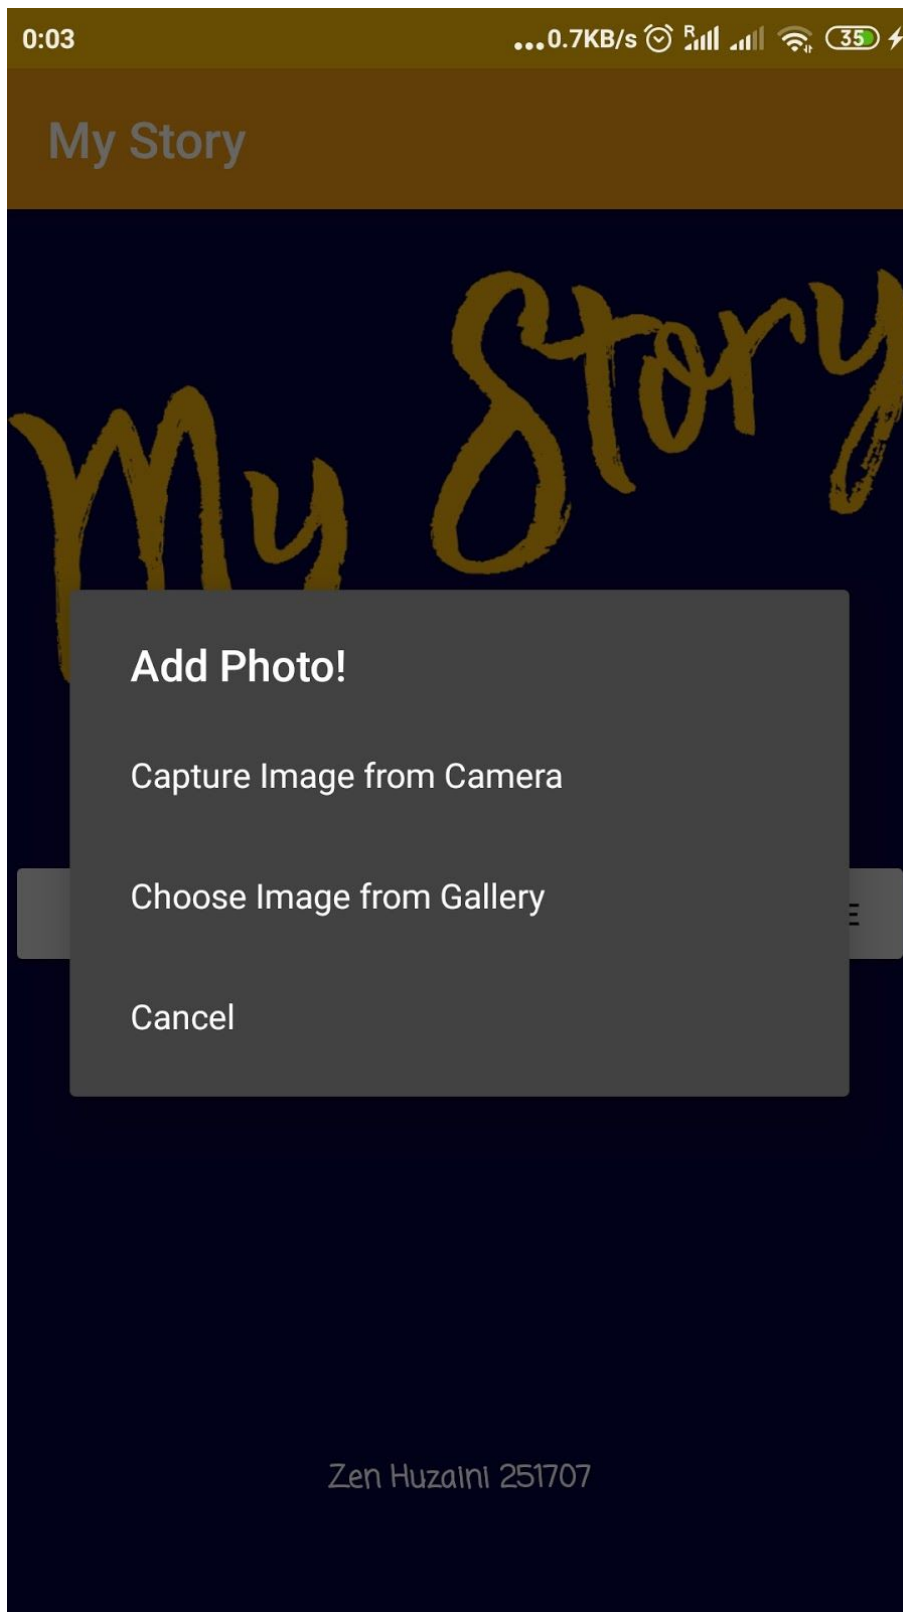

When add new is clicked, It will show a new layout that contains some fields to fill and “choose image option” to pick image.

The screenshot shows a mobile application interface with a dark blue background. At the top, there is a yellow header bar with a back arrow and the text "Save My Story". Below this, the text "Save your Story!" is displayed in yellow. A text input field with the placeholder "What is this story about ?" is shown, followed by a label "Describe your story". Below the text input, there is a yellow button labeled "CHOOSE IMAGE". At the bottom of the form, there is a large yellow button labeled "UPLOAD". The status bar at the top of the phone shows the time as 0:03, a data speed of 2.8KB/s, and a battery level of 35%.

If the button upload is clicked, then the data will be uploaded.

Here is the layout if the story image is clicked.

I use the intent for accessing media

When choosing image from gallery, I pick one of the image.

When the image is loaded, I can click Draw your story

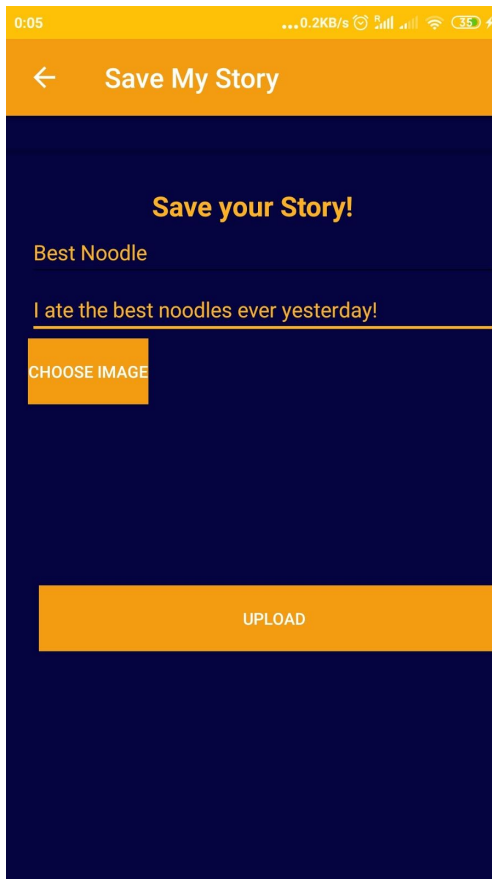

After that I can draw the line for the image. This feature can allow the picture to make the size of the brush bigger or smaller. Also it has possibility to change the color. When We finish. We can click save icon.

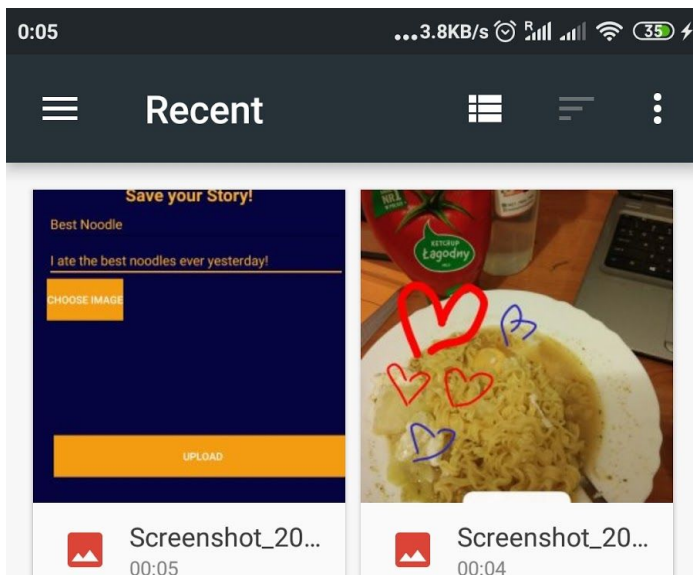

If the image is saved, there will be a notification toast that image has been saved to the gallery. After that we can press back or X icon to go back.

Here are some images when I tried to add the posts

When I access chose image, my gallery will be shown (if I choose to select the image from gallery)

Then I can pick the image.

0:06...0.1KB/s

Save My Story

Save your Story!

Best Noodle

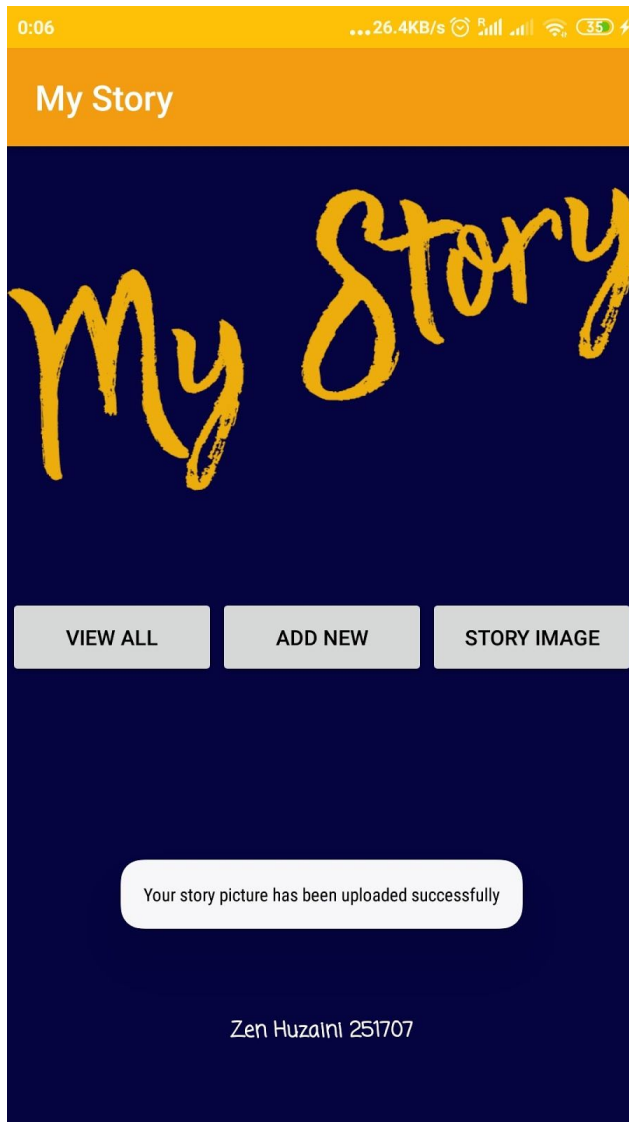

I ate the best noodles ever yesterday!

CHOOSE IMAGE

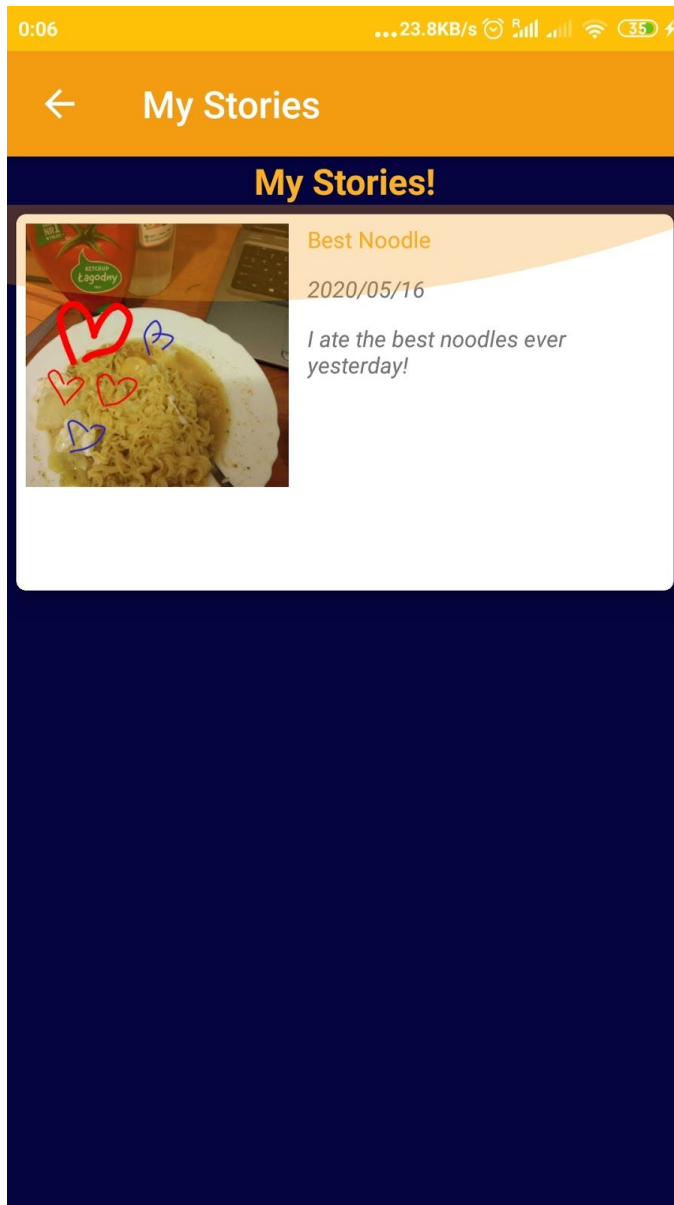

UPLOAD

When all the data has been inserted, Then wen can upload it

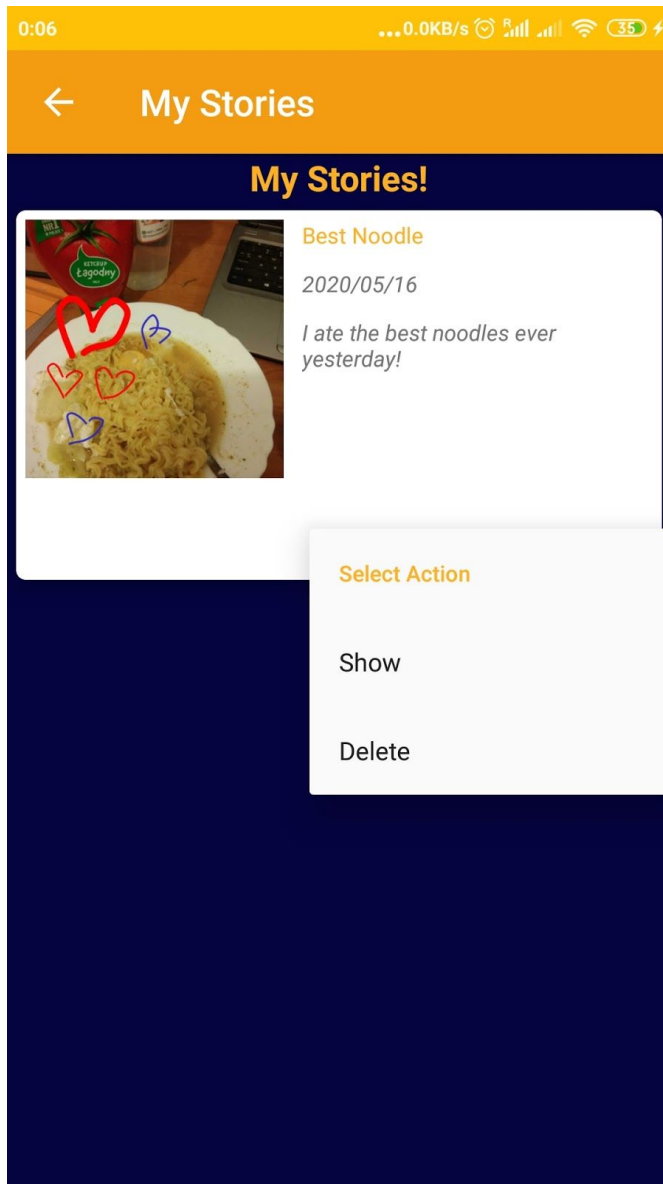

The toast will be shown if the picture has been successfully uploaded or not.

To check if the post has been uploaded or not, I click the view all. Then I can see that my post has been uploaded.

When I press long the post then some options will be shown

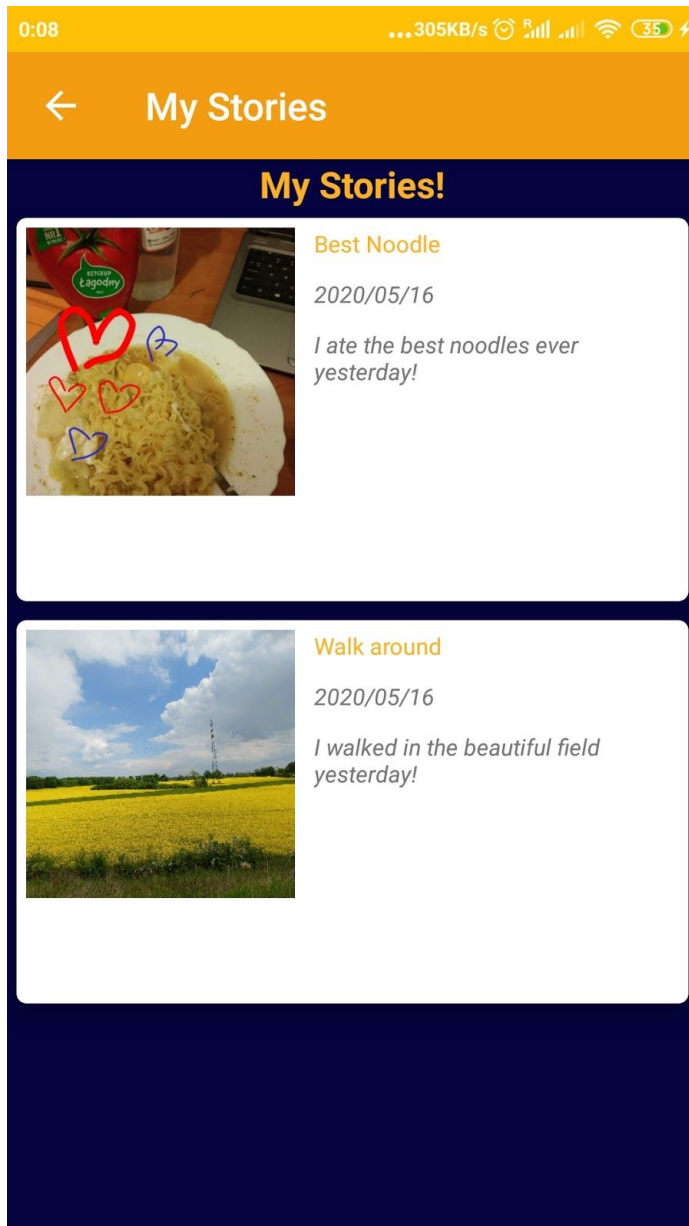

But the detail of the post will also be shown if we click the thumbnail directly

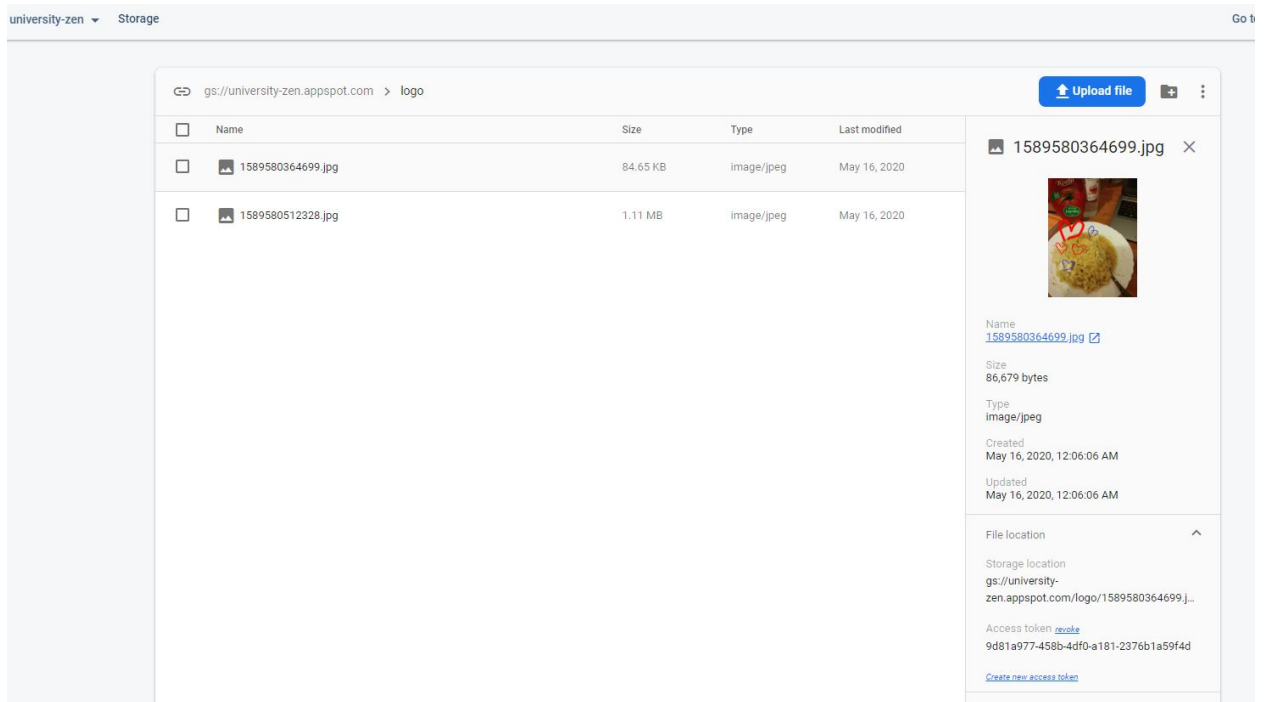

Here is the post details that I have.

I tried to add new post

I also checked if the image was uploaded in the firebase storage. And the image was uploaded to the storage

And the informations are all saved to database
